Abstract

What percentage of Americans have ever had a family member incarcerated? To answer this question, we designed the Family History of Incarceration Survey (FamHIS). The survey was administered in the summer of 2018 by NORC at the University of Chicago using their AmeriSpeak Panel. It was funded by FWD.us, which released a separate report using the data. The data show that 45 percent of Americans have ever had an immediate family member incarcerated. The incarceration of an immediate family member was most prevalent for blacks (63 percent) but common for whites (42 percent) and Hispanics (48 percent) as well. College graduates had a lower risk of having a family member incarcerated, but the risk for black college graduates was comparatively high. The most common form of family member incarceration was the incarceration of a sibling.

Keywords

mass incarceration, family, inequality, survey data

Introduction

Residents of the United States are incarcerated at a greater rate than residents of any other country in the world (Walmsley 2016). Their risk of incarceration, moreover, varies dramatically by race and class (e.g., Bonczar 2003; Pettit and Western 2004). Because incarceration undermines people's health (e.g., Massoglia and Pridemore 2015; Wildeman and Muller 2012; Wildeman and Wang 2017), removes them from the labor market and worsens their labor market prospects (e.g., Harding et al. 2018; Pager 2003; Western 2002), and interferes with their family lives (e.g., Comfort 2008; Comfort et al. 2018; Turney and Wildeman 2013), scholars have tied it to racial and class disparities in several dimensions of social and economic well-being (e.g., Wakefield and Wildeman 2013; Western 2006). With such a high risk of incarceration and such wide disparities in it, a growing body of research has examined Americans' likelihood of having a family member incarcerated.

Previous research has generated point-in-time estimates of the share of the population that currently has any family member imprisoned (e.g., Lee et al. 2015) and estimates of

the cumulative prevalence of having a parent imprisoned at the national (e.g., Wildeman 2009) and state and regional levels (e.g., Muller and Wildeman 2016). But two gaps in this area of research remain. First, although a substantial body of work has examined how parental incarceration affects children (e.g., Foster and Hagan 2015; Hagan and Dinovitzer 1999; Murray, Farrington, and Sekol 2012; Wakefield and Wildeman 2013), our understanding of the effects of having a family member other than a parent or romantic partner incarcerated is limited (e.g., Brown, Bell,

and Patterson 2016; Lee, Porter, and Comfort 2014; Roberts 2004; Western 2018; Wildeman, Schnittker, and Turney 2012). Second, we have estimates of the cumulative risk of imprisonment for American adults and the cumulative risk of parental imprisonment for American children but not the cumulative risk of lower levels of incarceration, such as spending time in jail. If we do not take into account these other types of incarceration and other types of family relationships, we will underestimate the share of people affected by the growth of incarceration since the early 1970s.

The Family History of Incarceration Survey (FamHIS) fills in these gaps in research by generating nationally representative estimates of the cumulative prevalence of incarceration and the incarceration of a family member across a range of family member types. It also enables us to study how these experiences are associated with survey respondents' health, opinions about the criminal justice system, and civic participation. In this article, we focus on the prevalence of family member incarceration. Although FWD.us has already published some of the descriptive statistics reported here (Elderbroom et al. 2018), we include additional information of special importance to research and academic audiences. Specifically, we (1) provide a more in-depth discussion of the rationale behind the survey, the survey weights, and how the data map on to the general population and (2) calculate confidence intervals for all estimates. In addition, we extend the analysis to consider (3) how the likelihood of having a family member incarcerated varies by both race and education and (4) survey respondents' own risk of incarceration. Future research using these data will explore how having a family member incarcerated is related to the outcomes listed previously.

In the next section, we describe our sample. Then we discuss the questionnaire, which is reproduced in its entirety in Appendix A. We close with a brief discussion of the findings, conclusions, and next steps.

Survey Methods

The sample relies on the probability-based AmeriSpeak panel, which is maintained by NORC at the University of Chicago. More information about AmeriSpeak is available from NORC (<https://amerispeak.norc.org/about-amerispeak/Pages/Panel-Design.aspx>). Three features of the panel are relevant to our study. First, NORC's use of field staff for in-person recruitment helps ensure that the sample is representative of young adults, households of lower socioeconomic status, households without access to the Internet, and other hard-to-reach households. Second, because AmeriSpeak is conducted in English and Spanish, our estimates for Hispanics are not likely to be biased by language barriers. Finally, because the AmeriSpeak panel allows respondents to answer surveys online and over the phone, it minimizes the underrepresentation of respondents who prefer not to use a computer.

For our sample, a total of 4,041 people—34 percent of the 11,992 panelists initially contacted about participating in the

FamHIS survey—completed an initial screener. The screener asked respondents whether they had ever had a spouse; partner; co-parent; biological, step, or adoptive parent; sibling; or child incarcerated. All 1,808 of those who responded affirmatively to this question were given the complete survey. We also randomly selected 1,009 respondents who reported that they had never had an immediate family member incarcerated to complete the full survey. This enables us to compare families that have and have not experienced the incarceration of an immediate family member.

The FamHIS data can be weighted using two weights, weight1 and weight2. As we show in the following, even the unweighted data closely match population estimates. However, these weights ensure that the FamHIS data even more closely represent the U.S. adult population. The weights, which were prepared and furnished by NORC, account for all stages of sampling and adjust the final sample to general population benchmarks. Additional detail about the construction of the survey weights is available in Appendix B.

Weight1 should be used to calculate incidence rates of having an immediate family member incarcerated. The incidence rates are based on the full sample ($n = 4,041$), because all respondents were asked whether they had ever had an immediate family member incarcerated. Weight2, which applies to all respondents who received the full questionnaire, should be used for all other analyses. Of the original 4,041 respondents, 1,806 reported that they have had an immediate family member incarcerated and received the full questionnaire.¹ Of the remaining 2,233 respondents, we randomly selected an additional 1,009 to receive the full questionnaire, for a total of 2,815 full questionnaire respondents. Weight2 adjusts for the fact that we subsampled among those who reported never having an immediate family member incarcerated and benchmarks all respondents who received the full questionnaire to the general population. A statistical comparison of the unweighted FamHIS, weighted FamHIS, and benchmark population-level weighted estimates from the 2012–2016 American Community Survey and General Social Survey are presented in Table 1, with a more fine-grained breakdown by racial/ethnic group in Appendix Tables C1 through C5.

Questionnaire

The full questionnaire is reported in Appendix A. Here, we describe three types of survey questions: questions used to measure the prevalence of family member incarceration, questions used to measure the prevalence of respondents' own incarceration, and the broader suite of questions asked to measure other aspects of respondents' lives that may have

¹One thousand eight hundred and eight respondents reported at least one immediate family member who had ever been incarcerated for at least one night, but 2 of these respondents skipped nearly all items in the full questionnaire and were therefore assigned missing values for weight2.

been affected by the incarceration of a family member, including attitudes toward the criminal justice system, levels and types of civic participation, and overall well-being.

Measuring Family Incarceration

In designing the family member incarceration questions, we used two definitions of family: one focusing on immediate family and the other focusing on extended family to whom respondents' reported feeling close. The immediate family question began as follows:

Many people have been held in jail or prison for a night or more at some point in their lives. Please think about your immediate family, including parents; brothers; sisters; children; and your current spouse, current romantic partner, or anyone else you have had a child with. Please include step, foster, and adoptive family members.

Confidentially and for statistical purposes only, have any members of your immediate family, NOT including yourself, ever been held in jail or prison for one night or longer?

Respondents who indicated that they had experienced the incarceration of an immediate family member were subsequently asked how many family members in each category had experienced this event. We code the incarceration of a family member conservatively: Respondents were only coded as having experienced the incarceration of a family member if they responded "yes" to the immediate family member question and also specified which family member had been incarcerated. Consequently, our estimates may slightly underestimate the prevalence of having a family member incarcerated.

In addition to information about immediate family members, we asked about the incarceration of extended family members. Specifically, we asked:

Now we would like you to think about any other, more extended, family members you feel close with who are not included in the earlier groups. As far as you are aware, have any of those other family members you feel close with ever been held in a jail or prison for a night or more at some point in their lives?

Respondents who answered affirmatively were given a list of relations including grandparents, grandchildren, cousins, aunts and uncles, nieces and nephews, godparents, mothers-in-law and fathers-in-law, sisters-in-law and brothers-in-law, and other family members.

We asked those who answered affirmatively to questions about whether an immediate family member had been incarcerated to report the length of the longest spell of incarceration their immediate family member experienced (1 day, 2 days to a month, 1 month to a year, 1–5 years, 6–10 years, and more than 10 years). We did this to differentiate families who may have had only very brief contact with the criminal justice system from those who were likely to have had more sustained

contact. Asking about the length of incarceration also enabled us to distinguish jail from prison incarceration without requiring respondents to distinguish between these types of facilities when describing the experiences of their family members.²

We asked those who answered affirmatively to questions about whether an immediate or extended family member had been incarcerated a set of follow-up questions about their experiences with the criminal justice system as related to their family member's incarceration. If the respondent had only one immediate family member incarcerated, subsequent questions focused on that family member. If the respondent had more than one immediate family member incarcerated, we randomly selected one immediate family member to focus on. We then asked how many times that family member had been incarcerated. If the family member had been incarcerated more than once, we asked respondents to focus on the most recent incarceration. We then asked how long their family member was incarcerated, whether their family member had experienced pretrial detention or accepted a plea deal, whether they visited their family member while they were incarcerated, how they felt about any visits they made to see that family member during their incarceration, and how they felt their family member's incarceration affected them financially, among other things. For those who did not have an immediate family member incarcerated but did have an extended family member incarcerated, we asked the same set of questions, again randomly selecting an extended family member if multiple extended family members had been incarcerated and asking the respondent to focus on the family member's most recent incarceration if they had multiple spells.

The data from all of these questions have been made available free of charge both through the FWD.us website and the Roper Center for Public Opinion Research at Cornell University so that researchers can verify and extend the results presented here and in the report (Enns et al. 2018).

Measuring Respondents' Own Incarceration

The questions about whether respondents themselves had ever been incarcerated, which were asked of everyone who completed the full survey, follow the same pattern as the questions about family member incarceration.

Additional Questions

There are two types of additional questions. The first allows us to study how the incarceration of a family member is associated with respondents' (1) experiences with police and the criminal justice system; (2) health and well-being; (3) opinions about crime, the police, the criminal justice system, and

²It is common for people to spend time in both jail and prison related to a single conviction, so we did not want to create confusion by asking respondents to differentiate between the two.

the government; (4) civic and political engagement; and (5) drug and alcohol use. We leave the analysis of these items to future work. As noted previously, all of these questions were asked of all respondents who had an immediate family member who had been incarcerated and a random selection of 1,009 respondents who had not.

The survey also includes demographic data, including respondents' political affiliation, religious denomination, race/ethnicity, age, gender, income, education, marital status, and household size. Additionally, we asked whether respondents were born in the United States.

Findings

All results presented in this article are weighted estimates of the cumulative prevalence of having a family member incarcerated at the national level. Supplementary tabulations of the disaggregated prevalence of respondents' own incarceration and the incarceration of their immediate and extended family members across sociodemographic groups not explored in the main manuscript are included in a series of four appendix tables (Appendix Tables C6–C9). As shown in Table 1, even the unweighted data (Column 1) are extremely similar to the U.S. adult population (Column 3). With the exception of some small differences in the shares of those with less than a high school education and in the highest income quintile, the FamHIS estimates align with population estimates from the American Community Survey and General Social Survey almost perfectly across all categories. The weighted estimates are even more similar.

Core Family Estimates

Figure 1 presents estimates of the cumulative risks of having a family member incarcerated in the United States. We report point estimates and confidence interval bounds in tabular form in Appendix C. For the incarceration of an immediate family member, we present estimates both for those who reported any family member incarceration (Panel 1) and those who reported that a family member had been incarcerated for at least one year (Panel 4). We use incarceration for longer than one year as a rough proxy for imprisonment. Information on the length of the longest incarceration is available only for immediate family members. Consequently, for both extended family incarceration (Panel 2) and total family incarceration (both immediate and extended family; Panel 3), we report estimates only for incarceration of any length (for at least one night). All estimates include 95 percent confidence intervals.

In Panel 1, we see that 45 percent of Americans have ever had an immediate family member in jail or prison.³ Whites (42 percent) and respondents recorded as other race (34 percent),

³This excludes 10 respondents who skipped the family incarceration question and 1 who indicated that they did not know if one of their family members had been incarcerated.

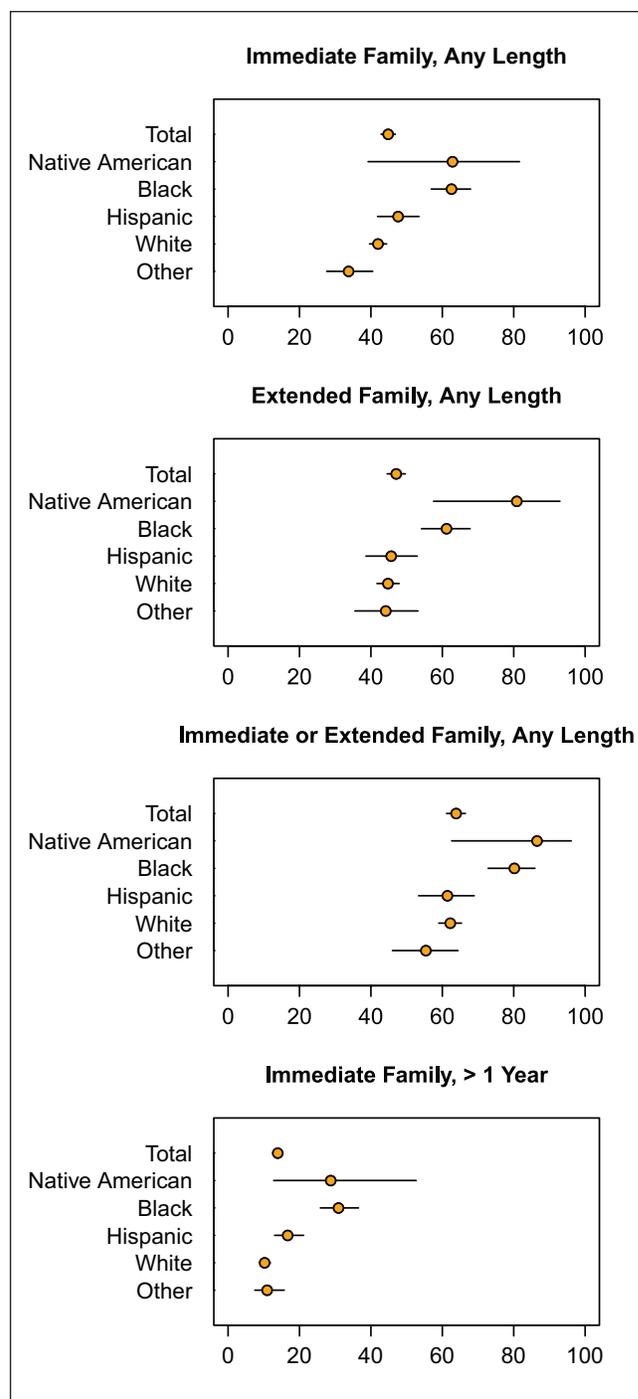

Figure 1. The risk of having an immediate or extended family member incarcerated for at least a night or longer than a year by racial/ethnic group.

many of whom identified as Asian or identified with two racial categories, are the only groups that have cumulative risks below the national average. Hispanics (48 percent) have risks similar to the national average, and blacks (63 percent) have risks far above the national average. Although Native Americans also have a risk far above the national average (63

percent), this estimate should be interpreted with caution given the large confidence interval, which reflects the small number of Native Americans in the sample. Panel 4 shows that 14 percent of Americans have had an immediate family member incarcerated in jail or prison for over a year. Whites and persons recorded as other race have slightly lower than average risks of experiencing the incarceration of an immediate family member for more than a year (10 percent and 11 percent) while blacks and Native Americans have significantly higher risks (31 percent and 29 percent).

The second panel of Figure 1 shows estimates of the number of Americans who have had an extended family member to whom they feel close incarcerated. We see that extended family member incarceration (47 percent) is roughly as common as immediate family member incarceration. With the exception of Native Americans (81 percent), for whom the data are able to provide only an imprecise estimate, blacks have the highest risk (61 percent) of having ever had an extended family member incarcerated for one night or more. The incarceration of an extended family member is also quite common for whites.

Panel 3 shows the percentage of Americans who have ever experienced any family member incarceration, including both immediate and extended family members. According to our estimates, a striking 64 percent of Americans have ever had any family member incarcerated. Blacks again experienced the incarceration of a family member at the highest rates among the groups for which we are able to generate stable estimates: Four in five black Americans have ever had a family member incarcerated for at least one night.

Figure 2 examines the cumulative risk of incarceration for each type of immediate family member. The most common form of family member incarceration in the sample was sibling incarceration, a result that holds across racial/ethnic groups. More than one in four American adults have had a sibling incarcerated for at least a night (27 percent). The rate for blacks is almost double the national average (48 percent). There is limited research on the impact of sibling incarceration in childhood and adulthood (Western 2018). These results point to the need for significantly more research on this topic.

Figure 3 presents the risk of having an immediate family member incarcerated, overall and by family member type, by respondents' education level. Although those with less than a high school degree have the highest cumulative risks (60 percent), it is striking that the incarceration of a family member is prevalent across respondents' levels of education. The main dividing line is between those who have a college degree and those who do not, but even among college graduates, the incarceration of an immediate family member was common (30 percent). Still, for some family relationships, educational differences at the bottom of the education distribution were stark. For instance, roughly one in three adults with less than a high school degree have had a parent (32 percent) incarcerated.

Figure 4 presents respondents' risk of having an immediate family member incarcerated by age and family member

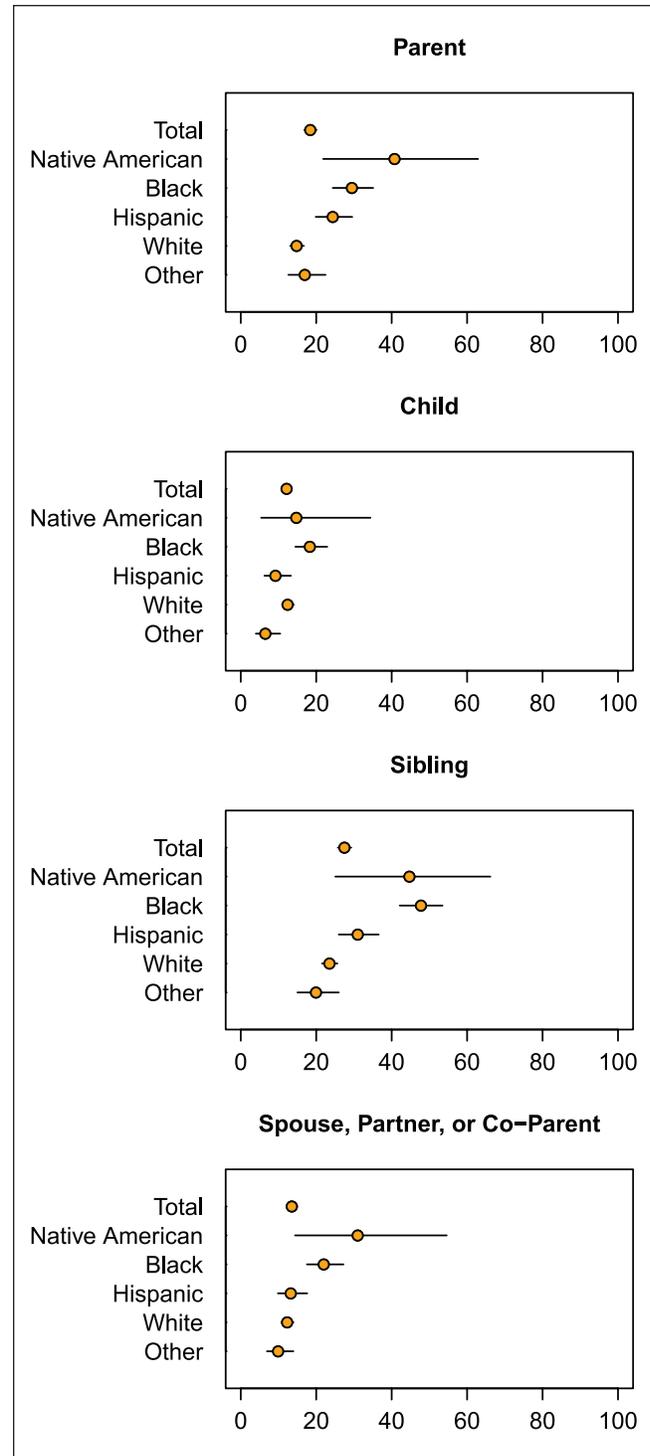

Figure 2. The risk of having an immediate family member incarcerated for at least a night by type of family member and racial/ethnic group.

type. The growth of parental incarceration within younger age cohorts is especially notable (Panel 2). One in three (34 percent) people between 18 and 29 years old have had a parent incarcerated while just 1 in 20 (5 percent) of people 70 or older report having ever had a parent incarcerated.

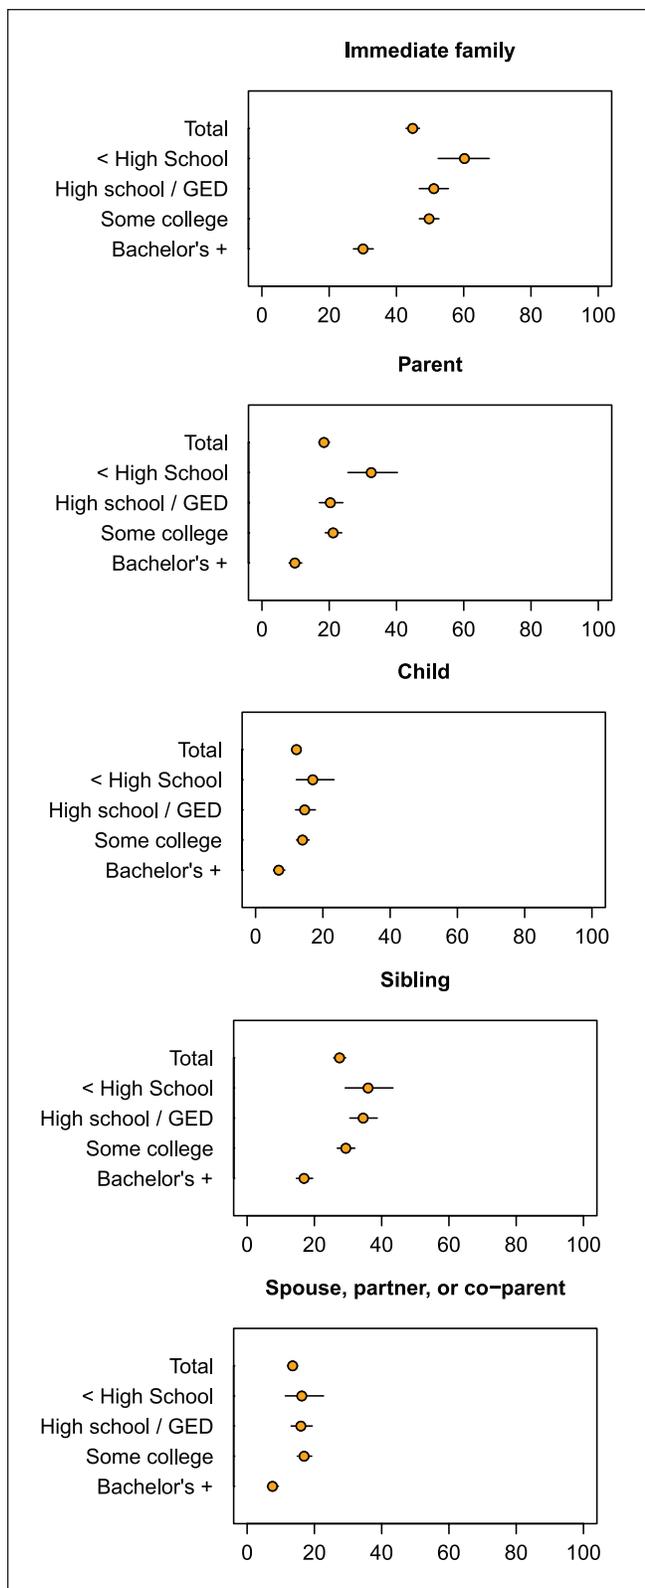

Figure 3. The risk of having an immediate family member incarcerated for at least a night by type of family member and education.

Conditional Risk Factors, Family Estimates

The FamHIS data enable us to examine the cumulative risk of family incarceration by many additional demographic characteristics, such as income level, religious and political affiliation, and foreign-born status. Furthermore, because of the large sample size ($n = 4,041$), we can estimate the conditional risk of family incarceration across multiple demographic characteristics. It will be especially important for future research to examine the risks associated with multiple economic and social circumstances as it is often the interaction of circumstances such as class and race that best predicts people’s likelihood of being incarcerated (e.g., Western 2006).

Figure 5 reports cumulative risks of family incarceration by sex, race/ethnicity, and duration.⁴ Looking at the top two panels, we see that women overall and white women in particular are more likely than men to have an immediate family member who has been incarcerated (48 percent vs. 42 percent; 46 percent vs. 38 percent, respectively). However, these differences do not exist for other racial groups, and the differences for whites disappear when we focus on immediate family members who have spent over a year incarcerated.

Figure 6 shows that the cumulative risk of having a family member incarcerated declines as education levels increase. However, this decline varies dramatically across racial groups. For example, among whites with a college degree, the cumulative risk of having a family member incarcerated for more than a year is about one-fifth the rate of whites with less than a high school degree (5 percent vs. 23 percent). By contrast, blacks with at least a college degree are only half as likely to have an immediate family member incarcerated for at least a year as blacks with less than a high school degree (23 percent vs. 46 percent). These results further highlight the unequal risk of imprisonment in the United States. Blacks with a college degree are just as likely to have a family member imprisoned as whites with less than a high school degree.

Estimates of Respondents’ Incarceration

Although the experience of having a family member incarcerated is the primary focus of the FamHIS study, the survey also asked about respondents’ personal experiences

⁴Even in our large national sample, American Indians and Alaska Natives represent just .7 percent (unweighted) of respondents. We do not include this group in Figures 5 or 6 because disaggregating by gender and education would further reduce the sample size. It is worth noting, however, that .7 percent closely tracks the estimated share of American Indians and Alaska Natives in the population aged 18 and above according to 2012–2016 American Community Survey estimates (see Table 1).

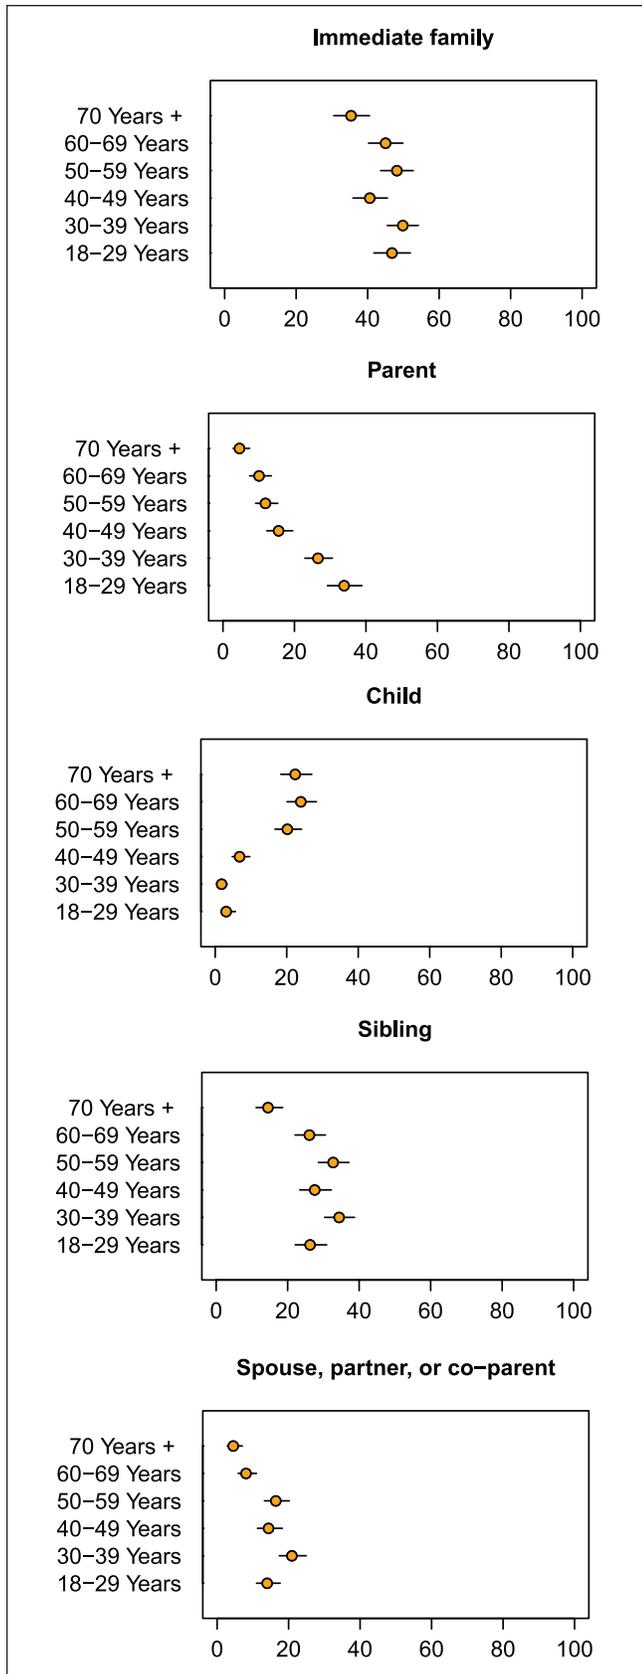

Figure 4. The risk of having an immediate family member incarcerated for at least a night by type of family member and age.

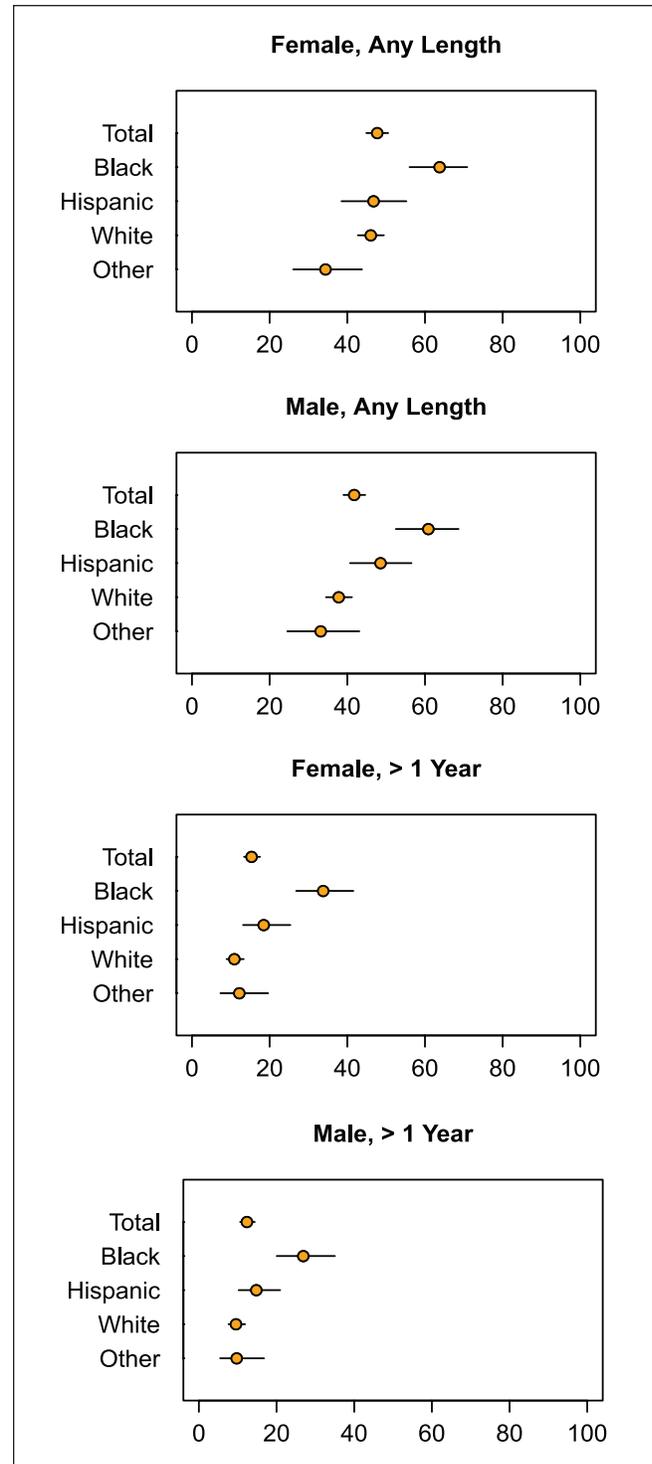

Figure 5. The risk of having an immediate family member incarcerated for at least a night or longer than a year by sex and racial/ethnic group.

with the jail and prison systems. Figure 7 presents estimates of the cumulative prevalence of incarceration among our respondents. It also reports variation in length of incarceration. The survey asked respondents who reported that

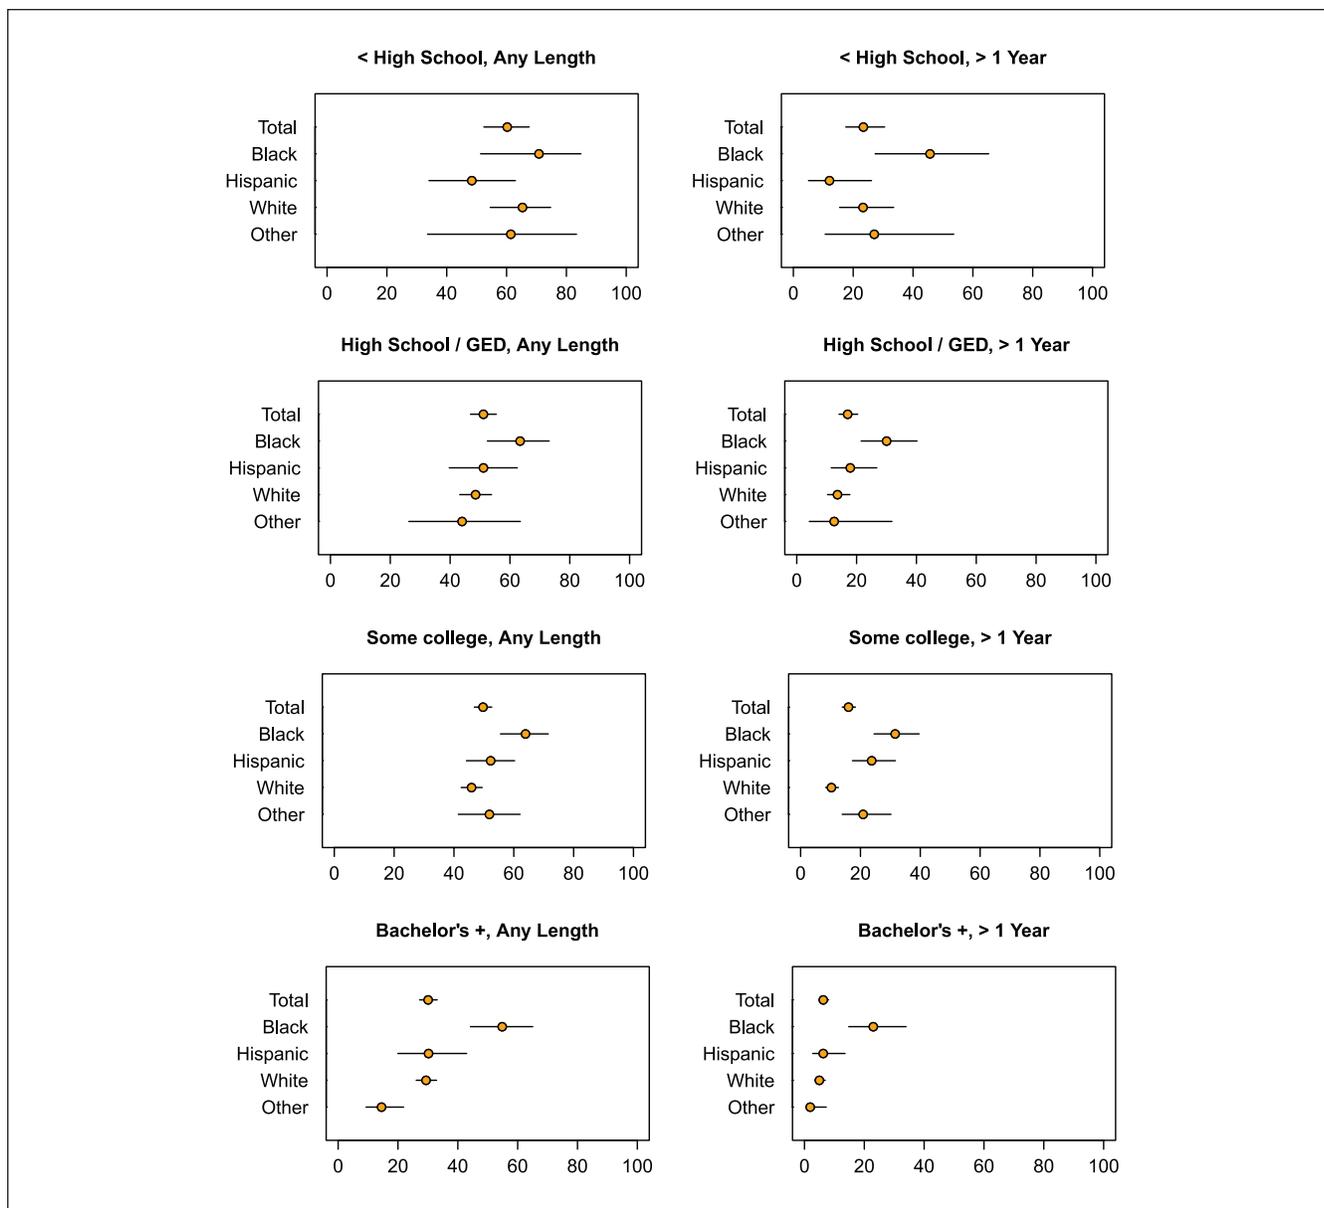

Figure 6. The risk of having an immediate family member incarcerated for at least a night or longer than a year by education and racial/ethnic group.

they had been incarcerated how many times they had been incarcerated and if they had been incarcerated once, the length of that incarceration. If they had been incarcerated multiple times, it asked the length of their most recent incarceration. Using this information, Figure 7 presents mutually exclusive categories of the duration of respondents' only or most recent incarceration. These estimates are unusual because existing data only measure imprisonment, not incarceration of other kinds (Bonczar 2003; Pettit and Western 2004). Racial disparities in the risk of incarceration are notable. For example, 31 percent of blacks have ever experienced incarceration compared to 17 percent of whites and Hispanics. It is important to emphasize that these

disparities are underestimated by the data because people who are currently incarcerated are not eligible for inclusion in the FamHIS study (Pettit 2012). In addition, people who have been to prison are a group that is especially hard to reach with traditional sampling methods (Western et al. 2016). For these reasons, our study is better equipped to measure the prevalence of having a family member incarcerated than of having been incarcerated oneself.

Conclusion and Next Steps

Our estimates support a number of conclusions. We focus on three. First, as the initial FWD.us report using these

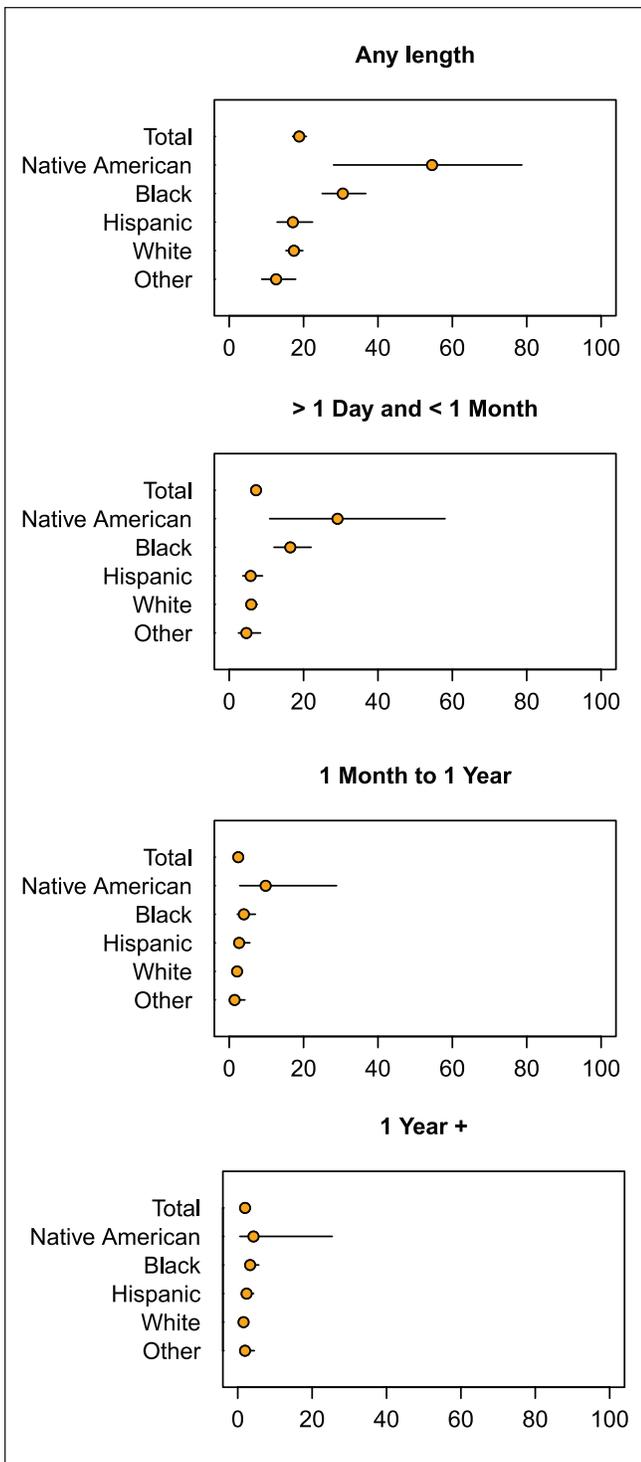

Figure 7. The risk of having been incarcerated by duration and racial/ethnic group.

data indicated (Elderbroom et al. 2018), having a family member incarcerated is a ubiquitous experience in the United States. Just under one in two (45 percent) Americans have ever had an immediate family member incarcerated. Roughly one in seven (14 percent) have ever had an immediate family member imprisoned—an estimate we derive by asking about incarceration for over a year. Second, although blacks and people with low levels of education experience exceptionally high rates of family member incarceration, with roughly three in five members of each of these groups reporting having ever had a family member incarcerated (63 percent for African Americans; 60 percent for people who did not complete high school), relatively more advantaged groups are far from immune to experiencing this event. People with a college degree stood out for having the lowest risks of family member incarceration, but the college advantage was much less pronounced for blacks. Moreover, in absolute terms, the overall percentage of college graduates who reported having a family member incarcerated was very high (30 percent). Finally, sibling incarceration, an experience that has received little attention (but see Western 2018), was the most common form of immediate family member incarceration. Just over one in four (27 percent) Americans reported having ever had a sibling incarcerated; for blacks, the number was nearly one in two (48 percent). Taken together, these estimates indicate that mass incarceration is a phenomenon that has touched many American families. The incarceration of a family member is the modal experience for blacks and people with low levels of schooling.

There is much more work to be done with these data. To facilitate this work, we will release the data in two stages. At each stage, the data will be made available free of charge through the Roper Center for Public Opinion Research. In the first stage, all data related to family incarceration were made publicly available the day the FWD.us report using them was released (Elderbroom et al. 2018). In the second stage, the full data will be released on September 1, 2019. We eagerly anticipate what further analyses of these data will yield. We are especially interested to learn how scaling by family size affects the estimates presented here and to examine what may be driving the decreasing racial/ethnic disparities in respondents' incarceration as the length of time served increases. The release of the FamHIS Study—the first nationally representative study designed explicitly to measure family member incarceration—provides a unique opportunity to understand how mass incarceration has affected the lives of many Americans.

This is a study about the criminal justice system, including policies on prisons and jails.

Este es un estudio sobre el sistema judicial penal, incluyendo políticas sobre prisiones y cárceles.

PROGRAM Q1 AND Q2 ON THE SAME SCREEN

[PROMPT FOR Q2]

[SP]

Q1.

How much confidence do you have in the criminal justice system in your area?

¿Cuánta confianza tiene usted en el sistema judicial penal de su área?

RESPONSE OPTIONS:

1. Very little confidence
2. Some confidence
3. A great deal of confidence

1. Muy poca confianza
2. Un poco de confianza
3. Mucha confianza

[SP]

Q2.

Many people have been held in jail or prison for a night or more at some point in their lives. Please think about your immediate family, including parents; brothers; sisters; children; and your current spouse, current romantic partner, or anyone else you have had a child with. Please include step, foster, and adoptive family members.

Muchas personas han estado en prisión o en la cárcel por una noche o más en algún momento de su vida. Por favor piense en su familia cercana, incluyendo a sus padres; hermanos; hermanas; hijos; y su actual esposo, pareja, o a cualquier otra persona con quien tenga un hijo/a. Por favor incluya a familiares adoptados, políticos o de crianza.

[SPACE]

Confidentially and for statistical purposes only, have any members of your immediate family, <u>NOT</u> including yourself, ever been held in jail or prison for one night or longer?

En forma confidencial y sólo con fines estadísticos, ¿alguno de los miembros de su familia más próxima, <u>SIN</u> incluirse a usted, ha estado en prisión o en la cárcel por una noche o más?

CAWI RESPONSE OPTIONS:

1. Yes
2. No, none of these family members were ever in prison or jail for one night or longer

1. Sí
2. No, ninguno de estos familiares ha estado en prisión o en la cárcel por una noche o más

CATI RESPONSE OPTIONS:

1. YES
2. NO

1. SÍ
2. NO

Q4LONG.

Thinking about your immediate family members who have
been held in jail or prison, what was the longest amount of
time that any one of your family members spent in jail or
prison?

Pensando en sus familiares cercanos que han estado en la
cárcel o prisión, ¿cuál fue la mayor cantidad de tiempo que
cuquiera de sus familiares pasó en la cárcel o prisión?

RESPONSE OPTIONS:

1. 1 day
2. 2 days to a month
3. Between a month and a year
4. 1-5 years
5. 6-10 years
6. More than 10 years

1. 1 día
2. De 2 días a un mes
3. De un mes a un año
4. 1-5 años
5. 6-10 años
6. Más de 10 años

[SP]

Q5.

Now we would like you to think about any other, more
extended, family members you feel close with who are not
included in the earlier groups. As far as you are aware, have
any of those other family members you feel close with ever
been held in a jail or prison for a night or more at some point
in their lives?

Ahora nos gustaría que usted piense en forma más extendida,
en otros miembros de su familia, con quienes se sienta cercano
y que no estén incluidos en los grupos anteriores. Según su
conocimiento,

¿alguno de estos otros familiares con quienes se siente cerca-
no ha estado alguna vez en prisión o en la cárcel por una
noche o más en algún punto de su vida?

[CATI] If you aren't sure, you can just say so.

Appendix B: Description of Statistical Weighting Provided by NORC

This description is taken directly from Family History of Incarceration Survey (FamHIS) survey documentation provided by NORC at the University of Chicago:

Statistical weights for the study eligible respondents were calculated using *panel base sampling weights* to start. *Panel base sampling weights* for all sampled housing units are computed as the inverse of probability of selection from the NORC National Frame (the sampling frame that is used to sample housing units for AmeriSpeak) or address-based sample. The sample design and recruitment protocol for the AmeriSpeak Panel involves subsampling of initial nonrespondent housing units. These subsampled nonrespondent housing units are selected for an in-person follow-up. The subsample of housing units that are selected for the nonresponse follow-up (NRFU) have their panel base sampling weights inflated by the inverse of the subsampling rate. The base sampling weights are further adjusted to account for unknown eligibility and nonresponse among eligible housing units. The household-level nonresponse adjusted weights are then post-stratified to external counts for number of households obtained from the 2018 Current Population Survey. Then, these household-level post-stratified weights are assigned to each eligible adult in every recruited household. Furthermore, a person-level nonresponse adjustment accounts for nonresponding adults within a recruited household.

Finally, panel weights are raked to external population totals associated with age, sex, education, race/Hispanic ethnicity, housing tenure, telephone status, and Census Division. The external population totals are obtained from the Current

Population Survey. The weights adjusted to the external population totals are the *final panel weights*.

Study-specific base sampling weights are derived using a combination of the final panel weight and the probability of selection associated with the sampled panel member. Since not all sampled panel members respond to the screener interview, an adjustment is needed to account for and adjust for screener nonrespondents. This adjustment decreases potential nonresponse bias associated with sampled panel members who did not complete the screener interview for the study.

Furthermore, among eligible sampled panel members (as identified via the survey screener questions), not all complete the survey interview for the study. Thus, the *screener nonresponse adjusted weights for the study* are adjusted via a raking ratio method to general population totals of U.S. adults (with or without family incarceration experience) associated with the following sociodemographic characteristics: age, sex, education, race/Hispanic ethnicity, and Census Division. The weights adjusted to the external population totals are the *final study weights*.

Raking and re-raking is done during the weighting process such that the weighted demographic distribution of the survey completes resemble the demographic distribution in the target population. The assumption is that the key survey items are related to the demographics. Therefore, by aligning the survey respondent demographics with the target population, the key survey items should also be in closer alignment with the target population.

There are two sets of final study weights. WEIGHT1 includes all screener completes ($n = 4,041$), and these cases are weighted to the general population. For analysis of the total screener completes ($n = 4,041$), use WEIGHT1. A second set of weights was also created for only the final survey completes ($n = 2,815$). These weights are benchmarked to the general population but are adjusted for the subsampled cases family incarceration experience. For analysis of the final survey completes ($n = 2,815$), use WEIGHT2.

Note: Estimates are weighted. Ninety-five percent confidence intervals are reported in parentheses.

Authors' Note

The third through seventh authors are listed alphabetically to indicate equal authorship. Anna Lifsec, Ava Laub, Gabriella Lifsec, Rebecca Jackson, and Tatiana Barraza provided research assistance.

Acknowledgments

We thank Gary Langer of Langer Research, Felicity Rose, and Laura Bennett for comments on the questionnaire and the article. The opinions expressed here are those of the authors and do not necessarily reflect or endorse the views of FWD.us.

Funding

The author(s) disclosed receipt of the following financial support for the research, authorship, and/or publication of this article: This study was funded by FWD.us, which published a separate summary of the design and findings (Elderbroom et al. 2018). The data and replication code for this article are available at the Roper Center for Public Opinion Research at Cornell University (<https://doi.org/10.25940/ROPER-31115615>).

Author Biographies

Peter K. Enns is associate professor of government and executive director of the Roper Center for Public Opinion Research at Cornell University. He is author of *Incarceration Nation: How the United States Became the Most Punitive Democracy in the World*.

Youngmin Yi is a PhD candidate in sociology in the Departments of Sociology and Policy Analysis and Management at Cornell University. Her research centers on the intersection of family life with the criminal justice, child welfare, and immigration systems in the United States, with an emphasis on social inequality and well-being in early life and the transition to adulthood. Her current work draws on survey and administrative data to examine the effects of institutional contact on family/household instability and health in childhood and adolescence.

Megan Comfort is a senior research sociologist with the Youth, Violence Prevention, and Community Justice program at RTI International and affiliated faculty in the Department of Medicine at the University of California, San Francisco. Her work focuses on the intersection of criminal justice involvement, family relationships, health, and well-being. She is the author of *Doing Time Together: Love and Family in the Shadow of the Prison* (University of Chicago Press, 2008), based on her ethnographic study of the "secondary prisonization" of women in relationships with incarcerated men. She also is a co-author with Tasseli McKay, Christine Lindquist, and Anupa Bir of *Holding on: Family and Fatherhood during Incarceration and Reentry* (University of California Press, 2019), which presents results from a large-scale mixed methods study of nearly 1,500 incarcerated fathers and their female partners.

Alyssa W. Goldman is a PhD candidate in the Department of Sociology at Cornell University. Her research examines the role of incarceration and other forms of criminal justice system contact in shaping racial and socioeconomic disparities in health and well-being. Her current research focuses on the health consequences of family member incarceration, particularly the implications of a child's incarceration for aging parents. Prior to pursuing her doctoral studies, she earned a master's degree in social science from the University of Chicago.

Hedwig Lee is a professor of sociology at Washington University in St. Louis (WUSTL). She also holds a courtesy joint appointment at the George Warren Brown School of Social Work at WUSTL and is an affiliate professor at the University of Washington Department of Sociology in Seattle. She is broadly interested in the social determinants and consequences of population health and health disparities. She currently serves on the research advisory board for the Vera Institute of Justice and the board for the Interdisciplinary Association for Population Health Science. She is also a member of The National Academies of Sciences, Engineering, and Medicine, Division of Behavioral and Social Sciences and Education, Committee on Population. Her recent work examines the impact of structurally rooted chronic stressors, such as mass incarceration, on health and health disparities.

Christopher Muller is assistant professor of sociology at the University of California, Berkeley. He is interested in historical approaches to the study of inequality.

Sara Wakefield is associate professor of criminal justice at Rutgers University, Newark. Her research interests focus on the consequences of mass imprisonment for the family, with an emphasis on childhood well-being and racial inequality. Most recently, she is working on several original data collection projects that leverage a variety of methods (surveys, intensive interviews, administrative data, and social network analysis) to more fully understand how social ties influence the conditions of confinement, community and family reintegration following incarceration, and social inequality.

Emily Wang is an associate professor of general medicine at the Yale School of Medicine, Director of the Health Justice Lab at Yale University, and co-founder of the Transitions Clinic Network. Her research and medical practice have focused on the epidemiology of incarceration, mitigation of the community-level impacts of gun

violence, and the care of individuals with histories of incarceration. She has served on the National Academy of Sciences/Institute of Medicine's committees focused on improving data collection on criminal justice system involvement and population health.

Christopher Wildeman is provost fellow for the Social Sciences, director of the Bronfenbrenner Center for Translational Research, and director of the National Data Archive on Child Abuse and Neglect at Cornell University, where he is also a professor of policy analysis and management and sociology (by courtesy). Since 2015, he has also been a senior researcher at the Rockwool Foundation Research Unit in Copenhagen, Denmark. His research and teaching interests revolve around the consequences of mass imprisonment for inequality, with emphasis on families, health, and children. He is also interested in child welfare, especially as relates to child maltreatment and the foster care system.
